CYBERCHECK ECOSYSTEM

Formal White Paper

A connected operating system for local business growth, discovery, verified trust, and partner-driven demand

Prepared for	Matthew Johnson
Document type	White paper / strategy document

This document synthesizes the platform model described across the uploaded CyberCheck, Gulf Coast Radar, CyberMate, Influencers, and aWavegent HTML pages.

Platform map

Layer	Role
CyberCheck	Business operating system: pages, booking, CRM, loyalty, automations, analytics, and app expansion.
Gulf Coast Radar	Consumer-facing discovery engine for restaurants, events, activities, specials, and local search.
CyberMate	Verified trust layer tying reviews to real transactions or completed services.
Influencers	Creator and referral marketplace for campaigns, gigs, and business-to-creator matching.
aWavegent	Vertical sales wrapper translating the platform into niche-specific landing pages.

Core idea: one business record powers the page, the booking or lead flow, the customer communication layer, the trust layer, and the public discovery surface.

Executive Summary

Local businesses still run through disconnected tools: one system for bookings, another for websites, another for SMS, another for reviews, and almost no clear link between activity and revenue. The uploaded pages describe a different model. CyberCheck acts as the business operating system. Gulf Coast Radar acts as the consumer discovery layer. CyberMate turns completed transactions or services into verified trust. Influencers creates creator-driven campaign and referral demand. aWavegent packages the same underlying stack into niche-specific sales pages for restaurants, charters, activities, rentals, and service businesses.

The core opportunity is not just a better profile page. It is a connected system where one business update can flow across the public page, booking path, directory visibility, customer messaging, post-visit review capture, and attribution reporting. That creates operational leverage for the merchant and stronger data value for the platform.

The Market Problem

Most local businesses are stuck with fragmented infrastructure. Menu changes do not sync to public listings. Open slots do not automatically turn into demand. Reviews are usually unverified. Customer communication is split across inboxes, forms, and manual follow-up. Even when the business is getting leads, it often cannot tell whether those leads came from search, social, SMS, a referral partner, or a local directory.

The uploaded pages consistently frame the solution around connected updates, source tracking, one dashboard control, and merchant-owned customer relationships. The product is positioned against operational drag more than against any single competitor.

Platform Architecture

The uploaded material describes a layered system rather than a single website. CyberCheck is the core operating layer for business pages, booking, CRM, automations, loyalty, waivers, payments, analytics, and app expansion. Gulf Coast Radar is the public discovery layer where locals and tourists search for restaurants, live music, activities, specials, and things to do. CyberMate is the verification layer that converts completed actions into trusted review data. Influencers is the creator and campaign layer. aWavegent is the niche-specific sales wrapper that makes the system easier to sell by vertical.

> **Execution discipline matters more than feature count. The strongest move is phased depth by vertical, not shallow breadth.**

How the Layers Work Together

The business profile becomes the canonical source of truth. That profile powers the public page, booking or lead flow, CRM event creation, customer communication, review requests, and local directory visibility. The same data model can support restaurants with QR menus and happy-hour

pushes, charters with tide or weather briefings, activities with same-day slot filling, and service businesses with lead capture and appointment reminders.

This structure matters because the competitive advantage is not any single feature. Booking alone can be copied. A link page can be copied. SMS tools can be copied. Verified reviews are harder, but still not enough by themselves. The defensible move is tying all of those functions into the same business workflow and data layer.

Vertical Strategy

The aWavegent pages show a clean vertical strategy. Restaurants are sold on QR menus, specials, reminders, and verified reviews. Charters are sold on booking flow, captain briefings, and post-trip review logic. Activities and rentals are sold on open-slot demand fill and source tracking. Service businesses are sold on lead capture, confirmations, reminders, and review follow-up.

That is strategically smart because owners do not buy software categories. They buy outcomes tied to their actual workflow. A restaurant owner does not wake up wanting a better stack; they want fewer stale menus, fewer missed reservations, and more repeat visits.

Monetization Logic

Three monetization patterns show up in the uploaded pages. CyberCheck uses SaaS-style pricing with a free Foundation tier, a Grow tier at 29 dollars per month, and a Platform tier at 79 dollars per month, with app usage billed separately. Gulf Coast Radar business pages use a network-based ladder with an entry level free for 90 days then 29 dollars per month, a 59-dollar Growth level, and a 99-dollar Platform level in the most mature version. aWavegent pages mostly avoid fixed public pricing and instead lean on launch-offer language and call-to-action based selling.

The upside is flexibility. The downside is brand confusion if those price ladders are exposed without a clear explanation of when each brand is speaking and why.

Execution discipline matters more than feature count. The strongest move is phased depth by vertical, not shallow breadth.

Strategic Strengths

The strongest strategic strengths in the uploaded material are: one connected business system; a public discovery layer that can create network effects; a verified trust layer tied to real completed events; creator and partner-driven growth; verticalized messaging that maps to actual workflows; and merchant-owned payment flow rather than platform-controlled funds.

Together, those strengths point toward a local commerce operating layer rather than a generic marketing site builder.

Key Risks

The biggest risk is fragmentation at the brand and message level. CyberCheck, Gulf Coast Radar, CyberMate, Influencers, and aWavegent all make sense internally, but they can easily look like five separate products if not orchestrated carefully. The second risk is pricing inconsistency across brands. The third risk is execution scope. The current vision spans bookings, CRM, loyalty, AI, trusted reviews, referral payouts, creator campaigns, and local search. That is a large surface area and requires phased rollout discipline.

Recommended Direction

The cleanest operating model is to let CyberCheck remain the platform and dashboard brand, let Gulf Coast Radar stay consumer-facing, treat CyberMate as the trust layer inside the platform story, and use Influencers as a marketplace program. aWavegent can stay as the vertical sales wrapper if it is improving conversion, but it should not create another independent identity problem.

The product should lead with one simple promise: one update keeps the whole business connected. Underneath that promise, the system can expand into deeper modules over time.

Conclusion

The uploaded pages describe a credible architecture for a connected local business platform. The opportunity is not just a directory, not just a booking tool, and not just a profile builder. It is a system that connects public visibility, operational workflow, messaging, trust, and partner growth around a shared business record. If the platform unifies its messaging, tightens its pricing story, and launches by vertical instead of trying to launch everything at once, it can create a differentiated position in local commerce infrastructure.

Appendix: surfaced pricing from uploaded pages

Brand or funnel	Pricing signal
CyberCheck	Foundation free; Grow 29 dollars per month; Platform 79 dollars per month; marketplace apps billed separately.
Gulf Coast Radar business page	Free for 90 days then 29 dollars per month; Growth 59 dollars per month; Platform 99 dollars per month in the most mature version.
aWavegent	Mostly sold through launch-offer and call-to-action language rather than fixed public pricing.
